

ABSTRACT OF THE DISCLOSURE

In a method and system for generating document templates for print jobs, in which a document template is generated in a generation unit using static resource data that are combined into addressable data sets. The document template is registered in a resource administration unit. The resource administration unit generates a resource list in which the resource data sets used by the document template are listed. Using the resource list, the resource administration unit controls a transfer of the used resource data sets to a data processing device in which the document template is supplemented with variable data, whereby the resource administration unit in turn can be controlled via a superordinate program.
